

Investment Strategy

VEGA is a low volatility, globally diversified asset allocation strategy that employs options seeking to enhance income and reduce risk. The volatility of each of the underlying positions drives option usage. During periods of high volatility the fund will write (or sell) a call option to hedge downside risk through income generation from the sale of options. 50%-75% of VEGA's equity positions will typically be covered. When volatility is low, the portfolio manager buys protective put options to manage downside risk. VEGA can serve as a core alternative allocation.

Before investing you should carefully consider the Fund's investment objectives, risks, charges and expenses. This and other information is in the prospectus, a copy of which may be obtained by visiting the Fund's website at www.AdvisorShares.com. Please read the prospectus carefully before you invest. Foreside Fund Services, LLC, distributor.

There is no guarantee that the Fund will achieve its investment objective. An investment in the Fund is subject to risk, including the possible loss of principal amount invested. Other Fund risks included: allocation risk; derivative risk; early closing risk; Exchange Traded Note risk; liquidity risk, market risk; trading risk; commodity risk; concentration risk; counterparty risk; credit risk; emerging markets and foreign securities risk; foreign currency risk; large-, mid- and small- cap stock risk. Please see the prospectus for detailed information regarding risk. The Fund is also subject to options risk. Writing and purchasing call and put options are specialized activities and entail greater than ordinary investment risk. The value of the Fund's positions in options fluctuates in response to the changes in value of the underlying security. The Fund also risks losing all or part of the cash paid for purchasing call and put options. The Fund may not be suitable for all investors.

Shares are bought and sold at market price (closing price) not net asset value (NAV) and are not individually redeemed from the Fund. Market price returns are based on the midpoint of the bid/ask spread at 4:00 pm Eastern Time (when NAV is normally determined) and do not represent the return you would receive if you traded at other times. The Morningstar Rating™ for funds, or "star rating," is calculated for managed products with at least a three-year history. Exchange-traded funds and open-ended mutual funds are considered a single population for comparative purposes. It is calculated based on a Morningstar Risk-Adjusted Return measure that accounts for variation in a managed product's monthly excess performance, placing more emphasis on downward variations and rewarding consistent performance. The top 10% of products in each product category receive five stars, the next 22.5% receive four stars, the next 35% receive three stars, the next 22.5% receive two stars, and the bottom 10% receive one star. The Overall Morningstar Rating for a managed product is derived from a weighted average of the performance figures associated with its three- and five-year Morningstar Rating metrics. The weights are: 100% three-year rating for 36-59 months of total returns, 60% five-year rating/40% three-year rating for 60-119 months of total returns.

**The VEGA Policy Benchmark is a blended benchmark of 37.5% MSCI World Index, 37.5% CBOE S&P 500 Buy/Write Index and 25% to the Bloomberg Barclays Intermediate Government Corporate Index. The MSCI World Index is a free float-adjusted market capitalization weighted index that is designed to measure the equity market performance of developed markets. The Bloomberg Barclays Intermediate Government Corporate Index is an unmanaged index considered representative of the performance of the U.S. investment grade Government and Corporate debt issuance. The CBOE S&P 500 Buy/Write Index (BXM) is a benchmark index designed to track the performance of a hypothetical buy-write strategy on the S&P 500 Index. Announced in April 2002, the BXM Index was developed by the CBOE in cooperation with Standard & Poor's. The BXM is a passive total return index based on (1) buying an S&P 500 stock index portfolio, and (2) "writing" (or selling) the near-term S&P 500 Index (SPXSM) "covered" call option, generally on the third Friday of each month. One cannot invest directly in an index. Option Writing portfolios use options as a significant and consistent part of their overall investment strategy. Trading options may introduce asymmetric return properties to an equity investment portfolio. These investments may use a variety of strategies, including but not limited to: put writing, covered call writing, option spread, options-based hedged equity, and collar strategies. In addition, option writing funds may seek to generate a portion of their returns, either indirectly or directly, from the volatility risk premium associated with options trading strategies. Alpha measures the risk-adjusted premium an investment earns above its benchmark. Beta measures the volatility of a security or a portfolio in comparison to the entire market. Standard Deviation measures the dispersion of a set of data from its mean and is calculated as the square root of variance. Information Ratio measures the active return of the manager's portfolio divided by the amount of risk that the manager takes relative to the benchmark. Sortino Ratio measures the excess return over the risk-free rate divided by the downside semi-variance, and so it measures the return to "bad" volatility. Sharpe Ratio measures the average return minus the risk-free return divided by the standard deviation of return on an investment. Down Capture Ratio measures an investment manager's overall performance in down-markets. Correlation measures how two securities move in relation to each other. Tracking Error measures how closely a portfolio follows the index to which it is benchmarked. R2 measures the percentage of a fund or security's movements that can be explained by movements in a benchmark index.
