

### Investment Strategy

DWEQ takes a modern targeted sector approach to domestic large cap equities. Using a technically driven process, DWEQ identifies industry sectors and companies with high relative strength and invests equally in the top ranked U.S. equity securities within the three highest ranked sectors. Regularly, DWEQ will rebalance its portfolio to maintain targeted exposure to the highest relative strength sectors and equal weighted allocation to the strongest stocks in those sectors. DWEQ seeks to add alpha by tactically targeting sectors based on the successful relative strength trend process.

### Investment Growth

Time Period: 12/27/2019 to 6/30/2022

AdvisorShares Dorsey Wright Alpha Equal Weight ETF (NAV)

**Before investing you should carefully consider the Fund's investment objectives, risks, charges and expenses. This and other information is in the prospectus, a copy of which may be obtained by visiting the Fund's website at [www.AdvisorShares.com](http://www.AdvisorShares.com). Please read the prospectus carefully before you invest. Foreside Fund Services, LLC, distributor**

Investing involves risk including possible loss of principal. The Advisor's judgment about the markets, the economy, or companies may not anticipate actual market movements, economic conditions or company performance, and these factors may affect the return on your investment. The prices of equity securities rise and fall daily. These price movements may result from factors affecting individual issuers, industries or the securities market as a whole. The Fund may experience relatively high portfolio turnover, which may result in increased transaction costs and performance that is lower than expected and potentially greater tax exposure.

Shares are bought and sold at market price (closing price) not net asset value (NAV) and are not individually redeemed from the Fund. Market price returns are based on the midpoint of the bid/ask spread at 4:00 pm Eastern Time (when NAV is normally determined) and do not represent the return you would receive if you traded at other times.

The S&P 500 Index is a broad-based, unmanaged measurement of changes in stock market conditions based on the average of 500 widely held common stocks. One cannot invest directly in an index. Large-blend portfolios are fairly representative of the overall U.S. stock market in size, growth rates, and price. Stocks in the top 70% of the capitalization of the U.S. equity market are defined as large cap. The blend style is assigned to portfolios where neither growth nor value characteristics predominate. These portfolios tend to invest across the spectrum of U.S. industries, and owing to their broad exposure, the portfolios' returns are often similar to those of the S&P 500 Index. Alpha measures the risk-adjusted premium an investment earns above its benchmark. Beta measures the volatility of a security or a portfolio in comparison to the entire market. Standard Deviation measures the dispersion of a set of data from its mean and is calculated as the square root of variance. Information Ratio measures the active return of the manager's portfolio divided by the amount of risk that the manager takes relative to the benchmark. Sortino Ratio measures the excess return over the risk-free rate divided by the downside semi-variance, and so it measures the return to "bad" volatility. Sharpe Ratio measures the average return minus the risk-free return divided by the standard deviation of return on an investment. Down Capture Ratio measures an investment manager's overall performance in down-markets. Correlation measures how two securities move in relation to each other. Tracking Error measures how closely a portfolio follows the index to which it is benchmarked. R2 measures the percentage of a fund or security's movements that can be explained by movements in a benchmark index.
